

Portfolio intelligence

From asset assumptions
to capital decisions

Model and dashboard demonstration
September 2026

Make the capital decision with a clearer view

Connect asset economics, portfolio constraints and the evidence behind each recommendation.

ASSET STRATEGY

Which action
creates value?

Compare Hold, Retrofit,
Repurpose, Redevelop and Sell on
a common basis.

PORTFOLIO STRATEGY

Which plan fits
the mandate?

Balance capital release, retained
income, project capacity and
downside risk.

DECISION GOVERNANCE

What must be
verified first?

Surface missing evidence and
explain why a candidate needs
further review.

A practical output: a ranked, constrained and explainable decision brief.

The challenge is connecting evidence to a decision

Common portfolio review challenges — to be confirmed against the client's current process.

- | | | |
|---|---|---|
| <div>1</div> <div>Fragmented evidence</div> <div>Leases, title, planning and costs</div> | → | Different owners and update cycles |
| <div>2</div> <div>Inconsistent economics</div> <div>Different time horizons and baselines</div> | → | Gross value can be confused with incremental gain |
| <div>3</div> <div>Competing objectives</div> <div>Asset returns, income and liquidity</div> | → | A strong asset idea may not fit the portfolio |

The platform makes assumptions comparable before it ranks the alternatives.

One workflow from inputs to investment review

Each stage produces an output that can be checked before the next decision.

10 fictional demo assets 5 action alternatives 15 dashboard sections

The public demonstration uses fictional assets; client deployment begins with verified client inputs.

The dashboard connects the overview to the asset case

A simplified, editable view of the implemented workspace; open the public dashboard for the full interface.

Market context sharpens the questions for each asset

Official sector histories provide a common external reference; leases and costs determine the asset case.

Singapore sector price indices | 2021 Q1 = 100

Office and retail indices cover the Central Region.

Two evidence layers

PUBLIC CONTEXT

Sector direction, dates
and source provenance

CLIENT UNDERWRITING

Lease income, title, costs
and transaction evidence

Divergent sector paths support differentiated assumptions — not a single growth rate.

Zoning produces four different decision inputs

Keep planning controls, ML signals, buildable capacity and investment value distinct.

PLANNING CONTEXT

Land use and GPR

Recorded controls,
spatial match and
verification flags.

Define the planning
case to investigate.

ML CHALLENGER

Evidence signals

Predicted class / GPR
band, uncertainty
and discrepancies.

Prioritise review
and monitoring.

CAPACITY SCREEN

Area and constraints

Floor-area headroom,
setbacks, height
and envelope options.

Specify candidate
development capacity.

ECONOMIC TEST

Costed alternatives

Full cash flows,
residual land value
and NPV versus Hold.

Compare development,
retention and sale.

Current integration: ML and detailed development values remain outside the main action rankings.

Zoning ML challenges the input evidence

Two model targets answer different questions; neither is an automatic Buy, Sell or Hold rule.

Current-zoning challenger

Does the record fit the observed context?

Land-use class / subtype / GPR band
Class confidence, entropy and abstention
Discrepancy status with reasons

Use: investigate mismatches and missing evidence.

Future-change model

Which sites merit closer monitoring?

Zoning / GPR change score
Separate from current land-use classification
Requires dated change labels and validation

Use: a watchlist or an explicit sensitivity case.

Current public demo: no trained predictions. ML scores do not feed action rankings.

Floor-area headroom identifies an option to investigate

DEMO-001: capacity and the separate detailed development model tell different parts of the story.

Core capacity screen: gross floor area (sqm)

2,184 sqm

Unused screened capacity

Requires verified controls
and a costed design.

Detailed redevelopment test: –S\$37.02m versus Hold, despite the indicated headroom.

Translate zoning information into a decision process

Decision-use framework: analyst review is required; the zoning-to-ranking connection is not implemented.

FINDING	WHAT THE TEAM DOES	DECISION IMPLICATION
ML mismatch or uncertain record	Check the boundary, title and controls.	Review / monitor; defer a final action.
Verified capacity and viable costs	Compare improved-use NPV with Hold.	Retrofit, Repurpose or Redevelop candidate.
Action economics favour retention or exit	Compare Hold with net sale proceeds; apply risk, income and liquidity limits.	Hold or Sell candidate; then portfolio review.

Buy is not implemented: acquisition price, transaction costs and a purchase benchmark are required.

Compare every action against the same Hold baseline

Incremental economics reveal what the proposed action adds after costs, timing and retained asset value.

Hold

Retain income

Retrofit

Improve the asset

Repurpose

Change the use

Redevelop

Rebuild the site

Sell

Release capital

$$\text{Incremental value} = \text{Action NPV} - \text{Hold NPV}$$

Count the whole cost

Capex, downtime and disposal

Model timing explicitly

Success, delay and failure

Separate debt from value

Financing is not project profit

The action plot makes the trade-off visible

DEMO-001: a fictional mixed-use asset. Higher expected value and lower modelled tail loss are preferred.

+S\$3.76m

Sell: expected gain vs Hold

S\$7.21m modelled 95% tail loss

A screening candidate,
subject to verified inputs.

Hold is the relative baseline, not risk-free.

The plot exposes the trade-off; the evidence gate decides whether it is actionable.

More floor area does not guarantee more value

Monthly development cash flows include full rebuild costs and the existing asset; distinct from annual screening.

DEMO-001: monthly investment NPV (S\$m)

–S\$37.02m

Incremental redevelopment NPV

ASSESSED LBC STILL REQUIRED

The candidate remains
not decision-ready.

Use planning capacity to screen an option; use full cash flows to judge the investment.

The best portfolio is not the sum of the top asset ideas

The income-retention mandate changes which independently attractive sales can be implemented together.

Illustrative asset counts

BASILINE MANDATE

Retain at least 70% of baseline operating income.

\$167.70m

Sale receipts

\$9.95m

Expected incremental NPV

70.1%

Baseline income retained

Your income mandate changes the capital plan

Re-optimize the same fictional portfolio while changing only the minimum retained-income requirement.

A policy choice,
made explicit

More income retained
means less capital
available from sales
in this demonstration.

Agree the mandate first. Then compare feasible plans against it.

A positive expected value can still carry material downside

The two-stage model tests a portfolio commitment across three market cases with assumed weights.

Two-stage portfolio: incremental NPV by case (\$m)

\$7.63m

Probability-weighted NPV

Downside case:
-S\$11.28m

Review expected gain and downside together before committing capital.

Digital twins test how the action mix changes

A separate generated underwriting population explores base, stress and structural-change environments.

Constrained expected incremental NPV (\$m)

PORTFOLIO SALES	
Base	6
Stress	6
Structural	2

Compare allocations as well as totals: the action mix changes with the environment.

An attractive candidate still needs decision-ready evidence

The dashboard separates economic screening from legal, planning and underwriting verification.

PUBLIC DEMO: ALL 10 ASSETS REQUIRE DATA

Missing evidence remains visible;
it is not converted into false certainty.

Turn possible alpha into a testable hypothesis

The present evidence supports a working decision system. Investment outperformance still needs validation.

01

Specify the edge

Identify a repeatable leasing, timing or repositioning hypothesis.

02

Test out of sample

Use dated inputs and an untouched holdout; compare with a baseline.

03

Run a client pilot

Measure decision time, net outcomes and forecast calibration.

No validated alpha claim today. Agree the benchmark before measuring improvement.

A modular system supports a staged client deployment

Separate data, economic calculations and the dashboard so each layer can be reviewed and extended.

Start with a pilot that has measurable acceptance criteria

Proposed scope: a small, representative asset set and one agreed investment decision mandate.

GATE 1

Establish the baseline

Validate source data.
Reproduce current
underwriting decisions.

GATE 2

Review real alternatives

Run agreed scenarios.
Explain differences and
resolve material gaps.

GATE 3

Measure and decide

Compare with the baseline.
Accept, refine or stop
before wider rollout.

Measure: review time • verified inputs • reconciliation • decision quality

Start with one portfolio and one decision mandate

A focused proof of value can show which decisions improve — and what evidence is still missing.

01

Choose the assets

A representative sample
with accessible records.

[Explore the public dashboard →](#)

02

Define the mandate

Return, risk, income
and liquidity priorities.

[Read the detailed report →](#)

03

Agree the benchmark

Current decisions and
measurable acceptance.

[Inspect the assumptions.
Make the decision.](#)
