

From asset information to a portfolio decision

Read the financial path from left to right; planning studies support a separate analyst review.

Demo overview | the dashboard follows the decision

A simplified workspace view shows the candidate, its economics and what still needs verification.

03 Explain the decision

1

Compare against Hold

2

Inspect downside risk

3

Review missing evidence

4

Test the portfolio fit

OUTPUT

A candidate for review, with its rationale and evidence status.

Use the linked tab labels on each slide to jump into the public dashboard.

Demo overview | Fictional assets and saved results | 25 September 2026

02

Asset and evidence | establish what is known

Choose one asset, inspect its assumptions and separate supplied information from verified evidence.

OPEN TABS

Asset

Evidence

INPUT

Selected asset + value and income assumptions + source records, dates and planning context.

OUTPUT

An asset case with visible assumptions and a readiness status.

The demo can continue with provisional inputs; this does not establish decision readiness.

Zoning ML | prioritise the right investigation

The challenger checks consistency; the separate change model is a research capability.

OPEN TABS

Zoning ML

Zoning

INPUT

Planning records + asset and location features + model training and calibration evidence.

OUTPUT

A review priority or an explicit lack of evidence—not a trade instruction.

Public demo: fictional examples; ML outputs are not connected to the main ranking engine.

Zoning and development | test the physical option

Capacity identifies what may fit; a costed development case tests whether it creates value.

OPEN TABS

Zoning

Development

INPUT

Site area and GPR + height, setbacks and footprint assumptions + construction and project costs.

OUTPUT

DEMO-001: 2,184 sqm headroom; redevelopment NPV –S\$37.02m versus Hold.

Separate feasibility screen. These detailed values do not feed the main action rankings.

Valuation and actions | make alternatives comparable

Each action is valued against retaining the same property, using the main annual model.

OPEN TABS

Valuation

Actions

INPUT

Current value and net operating income + rent, vacancy, cap rate, costs and timing assumptions.

OUTPUT

Five comparable action values, before scenario and portfolio decisions.

Hold is the zero incremental baseline; Buy is not part of the implemented action set.

Scenario analysis | show the range around the value

Expected value is one outcome measure; downside determines how much uncertainty accompanies it.

OPEN TABS

Scenario

INPUT

Action cash flows + shared market, approval and cost assumptions + asset-specific uncertainty.

OUTPUT

DEMO-001 Sell: +S\$3.76m expected NPV; 24.4% loss probability; S\$7.21m CVaR.

CVaR describes the average loss in the worst 5% of simulated outcomes.

Selection | rank the action, then test readiness

The preferred financial action and the operational evidence status answer different questions.

OPEN TABS

Selection

Actions

INPUT

Hold · Retrofit · Repurpose · Redevelop · Sell, each with expected NPV and downside estimates.

OUTPUT

DEMO-001: Sell scores +S\$1.59m; the evidence status remains Data Required.

Data Required / Monitor does not mean that Hold wins the economic comparison.

Optimiser | choose a plan that fits the portfolio

An attractive standalone action may change once funding, retained income and execution limits apply.

OPEN TABS

Optimiser

INPUT

All asset alternatives + capital and liquidity budgets + income, project and development limits.

Other views: two-stage contingent plans and assumption-sensitivity checks.

OUTPUT

A feasible model schedule with explicit constraints and funding requirements.

Public demo displays saved plans; new calculations require the backend.

Digital twins | compare decisions across environments

Explore a separate synthetic population and see which choices change when assumptions move.

OPEN TABS

Digital Twins

INPUT

Choose an environment, then filter the synthetic assets whose decisions you want to inspect.

OUTPUT

A sensitivity view of asset choices, portfolio choices and their differences.

Filtering the asset table does not rerun the full portfolio plan. Results are synthetic experiments.

Review segments | explain the result before acting

Use diagnostics, the model map and the evidence trail to explain the recommendation and its limits.

OPEN TABS

Models

Architecture

Audit

INPUT

The candidate action and portfolio plan + diagnostic results + assumptions and source information.

Models

Inspect diagnostics and data status.

Architecture

Understand the calculation path.

Audit

Review input readiness and gaps.

Explain the decision

Why this candidate?
What could make it wrong?
Which inputs need verification?
What changes the portfolio fit?

Human investment review

Proceed to underwriting,
request more evidence,
or revise the proposal.

OUTPUT

An understandable decision brief and a clear next review step.

The dashboard supports analysis; investment approval and execution happen outside the demo.
